

Privet senna

(*Senna ligustrina*)

For definitions of botanical terms, visit en.wikipedia.org/wiki/Glossary_of_botanical_terms.

Also known as Privet wild sensitive plant, Privet senna is an evergreen, perennial shrub that produces many 5-petaled, butter-yellow blooms. Its long, pinnately compound leaves are alternately arranged and comprised of numerous dark green, linear- to lanceolate-shaped leaflets. Its fruit is a thin bean pod, about 5 inches long, that turns a deep brown when ripe.

The flowers are mainly bee-pollinated, but privet senna is the larval host plant for the cloudless sulphur and sleepy orange butterflies. A gland at the leaf base attracts ants that kill the caterpillars.

Privet senna is a short-day plant, which means it requires a longer period of darkness to form its flowers. Thus it flowers early autumn through late spring when our nights are longer. It occurs naturally in hammocks and disturbed areas. All species of *Senna* are larval host plants for sulphur caterpillars.

The genus *Senna*, along with the genus *Chamaecrista*, were originally considered *Cassia* by Carl Linnaeus. DNA analyses, however, have since shown that all three genera are monophyletic, meaning they each descended from a single taxon. Despite this, the relationship between the three genera has not yet been resolved.

Family: Fabaceae (Legume or bean family)

Native range: Gulf coast, south and southeast peninsula/coast

To see where natural populations of Privet senna have been vouchered, visit www.florida.plantatlas.usf.edu.

Lifespan: Perennial

Soil: Dry to slightly moist well-drained sand; can grow in nutrient-poor soils but does better with some organic content

Exposure: Full sun to light shade

Growth habit: 3–8' tall, up to 6' wide but usually taller than wide

Propagation: Seed

Florida regions of landscape suitability: North, Central, South

Garden tips: Privet senna is fast-growing, often reaching its full height in a single growing season. It is a prolific self-seeder and should be pruned to prevent an abundance of seedlings. It can also be somewhat unattractive when it becomes covered in its many large, brown seed pods. It is not salt-tolerant.

Privet senna plants are often available at nurseries that specialize in native plants. Visit www.PlantRealFlorida.org to find a nursery in your area.
