

Swamp rosemallow

(*Muenchhusia grandiflora*)

For definitions of botanical terms, visit en.wikipedia.org/wiki/Glossary_of_botanical_terms.

Swamp rosemallow is a deciduous perennial wildflower with showy pink blooms. Its solitary flowers are large and somewhat nodding; they have 5 whitish-pink to rose-colored petals and red centers. Leaves are deltoid to heart-shaped, have toothed margins and are alternately arranged. They are grayish-green in color and velvety, giving the foliage a silvery tone. Stems and bracts are pubescent, as are the capsules.

Swamp rosemallow blooms from summer into early fall. It occurs naturally in marshes and swamps, in wet ruderal areas, and along edges of lakes, ponds and rivers. It is often seen in large masses in open marsh areas.

This species was previously known as *Hibiscus grandiflorus* and may still be referenced as such in online and print resources.

Family: Malvaceae (Mallow family)

Native range: Nearly throughout Florida

To see where natural populations of Swamp rosemallow have been vouchered, visit www.florida.plantatlas.usf.edu.

Lifespan: Perennial

Soil: Moist to inundated sand or muck

Exposure: Full sun

Growth habit: 6–10' tall

Propagation: Seeds

Florida regions of landscape suitability: North, Central, South

Garden Tips: Due to its size, swamp rosemallow is best suited for broad, expansive landscapes, but can also serve as a beautiful centerpiece in a mixed container planting. It may be propagated by seed.

Swamp rosemallow seeds may be available from the Florida Wildflower Cooperative at www.FloridaWildflowers.com. Plants are often available at nurseries that specialize in native plants. Visit PlantRealFlorida.org to find a native nursery on your area.
